

# Hardware & Software -

There are many types of hardware and software programs that are used in today's schools. The types of hardware devices that a school has access to, will affect the school's overall technology effectiveness. If the school is equipped with computers that are out of date, the school will have a difficult time implementing successful technology plans.

Technology is always changing. It is too hard and too costly for a school to always have the most up to date hardware and software. As Moore's Law explains, the newest computer today, will be old in 2 years, meaning that a better computer with greater capability, speed and processing, will be created at least every two years.

It would be nice to be equipped with the newest and best computers, but we have to make the most of what we have.
